Reg. No. 33,112

comprises means for modulating the selected carrier frequency with a modulation signal representing data to be transmitted.

13. A test method in an RF communication system in which at least two RF communication channels respectively lying about known carrier frequencies are present in an RF communication band, the method comprising:

downconverting one of said RF communication channels to an intermediate frequency <sup>for diagnostic purposes</sup> for diagnostic purposes using a downconverting signal, where the frequency of the downconverting signal is selected based on the known carrier frequencies of the communication channels such that the other communication channel is not downconverted with the downconverted communication channel as an image frequency. and using said down-converted one of said RF communication channels as a diagnostic signal in said test method.
